DETAILED ACTION

Claim Rejections - 35 USC \$ 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1, 5, 8, 12, and 14 are rejected under 35 U.S.C. 102(b) as being anticipated by Schilbe et al (US 6,132,520). Schilbe teaches a thermal barrier coating on a metal substrate. The coating includes a MCrAlY bond coat, where M may be nickel and/or cobalt. The bond coat may have a thickness of 1-10 mils, or 5-8 mils. The bond coat may be applied by spraying. An outer thermal insulating layer comprises a ceramic such as YSZ, and may have a thickness of 2-20 mils. The outer thermal insulating layer may also be applied via spray method. The thicknesses of Schilbe substantially overlap with the ranges of the instant claims.

Claims 1-14 are rejected under 35 U.S.C. 102(b) as being anticipated by Nissley et al (US 6,102,656). Nissley teaches an abradable ceramic coating for a turbine engine component substrate. The substrate may comprise a metal superalloy. A bond coat of a MCrAlY material, wherein M is Ni, Co, Fe or mixtures thereof, is provided on the substrate and under the ceramic layer. The bond coat may have a thickness of 5-10 mils, preferably 6-7 mils. The bond coat may be applied via spray method. The abradable ceramic layer comprises YSZ, and has a thickness of 20-75 mil, preferably about 50 mils. The abradable ceramic layer is also deposited via a spray method.

Regarding claims 2, 3, 9, and 10, polyester may be added to the ceramic layer. The amount of polyester may be about 1 to about 7 wt%.

Art Unit: 1775

Regarding claims 4 and 11, Nissley teaches that 50 mils may be the thickness of the ceramic coating, which falls within applicant's claimed range.

Regarding claims 6 and 13, Nissley teaches that the MCrAlY coating may also contain silicon and hafnium.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 4, 7, and 11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Schilbe et al (US 6,132,520). Schilbe teaches a thermal barrier coating on a metal substrate as discussed above. Schilbe teaches that the coating is for turbine blades, vanes and other components of a turbine engine. Schilbe does not specifically teach that the coating is on an inner shroud cover plate. It would have been obvious to one of ordinary skill in the art at the time of the invention to apply the thermal barrier coating of Schilbe to any surface of a turbine engine which is exposed to corrosive environments and would benefit from a protective coating. It is well known in the art of turbine engine components that protective coatings such as that taught by Schilbe prolong the life of the engine components.

Regarding claims 4 and 11, it would have been obvious to one of ordinary skill in the art at the time of the invention to apply the ceramic coating with a thickness sufficient to provide thermal insulation to the underlying substrate. While Schilbe teaches an upper limit of 20 mils, it would have been obvious to one of ordinary skill that a thicker layer can be applied to effect an increase in thermal insulation.

Art Unit: 1775

Claims 3, 7, and 10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Nissley et al (US 6,102,656). Nissley teaches an abradable ceramic coating as discussed above. Nissley teaches that polyester may be added to the ceramic layer to intentionally create porosity. The amount of polyester that may be added is about 1 to about 7 wt%. Nissley does not give specific examples of amounts of polyester added within this range. It would have been obvious to one of ordinary skill in the art at the time of the invention to add polyester in a any amount within the range of 1-7 wt% as it is clearly taught as a workable range to obtain the desired porosity. One of ordinary skill in the art at the time the invention was made would have considered the invention to be obvious because the compositional proportions taught by Nissley overlap the instantly claimed proportions and therefore are considered to establish a prima facie case of obviousness. It would have been obvious to one of ordinary skill in the art to select any portion of the disclosed ranges including the instantly claimed ranges from the ranges disclosed in the prior art reference, particularly in view of the fact that;

"The normal desire of scientists or artisans to improve upon what is already generally known provides the motivation to determine where in a disclosed set of percentage ranges is the optimum combination of percentages", In re Peterson 65 USPQ2d 1379 (CAFC 2003).

<u>Also, In re Geisler</u> 43 USPQ2d 1365 (Fed. Cir. 1997); <u>In re Woodruff</u>, 16 USPQ2d 1934 (CCPA 1976); <u>In re Malagari</u>, 182 USPQ 549, 553 (CCPA 1974) and MPEP 2144.05.

Regarding claim 7, Nissley teaches that the coating is for turbine blades, vanes and other components of a turbine engine. Nissley does not specifically teach that the coating is on an inner shroud cover plate. It would have been obvious to one of ordinary skill in the art at the time of the invention to apply the thermal barrier coating of Nissley to any surface of a turbine engine which is exposed to corrosive environments and would benefit from a protective coating. It is well known in the art of turbine engine components that protective coatings such as that taught by Nissley prolong the life of the engine components.

Art Unit: 1775

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jennifer C McNeil whose telephone number is 571-272-1540. The examiner can normally be reached on 9AM-6PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Deborah Jones can be reached on 571-272-1535. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
